# Skill-to-Salary Intelligence System

## Case Study Report

## Team Members

• Shaik Ibrahim – Frontend Development & Visualization
• Farhan – Data Collection & Data Preprocessing
• Nawaz – Machine Learning Model Development
• Jabeer – Backend Integration & Testing
• Abubakar – Documentation & Presentation

## 1. Introduction

The Skill-to-Salary Intelligence System predicts expected salaries based on skills, experience, location, and seniority. It helps students and job seekers understand their market value in the software industry.

## 2. Problem Statement

Salary estimation is often subjective and time-consuming. This project provides a data-driven approach to estimate salaries using industry-relevant factors.

## 3. Objectives

• Predict salary ranges
• Help students plan careers
• Analyze impact of skills and experience
• Demonstrate AI/ML concepts

## 4. Technologies Used

Python, Streamlit, CSS, Machine Learning Concepts, Google Colab, GitHub

## 5. Key Features

• Salary Prediction Engine
• Interactive Dashboard
• Skill-Based Analysis
• Location-Based Salary Adjustment
• Salary Assistant Chatbot

## 6. Team Contributions

**Shaik Ibrahim:** Frontend Development & Visualization
**Farhan:** Data Collection & Data Preprocessing
**Nawaz:** Machine Learning Model Development
**Jabeer:** Backend Integration & Testing
**Abubakar:** Documentation & Presentation

## 7. Conclusion

The project successfully demonstrates a practical salary prediction system for the IT industry. It combines software development, visualization, and machine learning concepts into a user-friendly solution.
